ABOUT

The MS Access program is a database management system (ACCDB) included in the popular Microsoft Office package. It allows you to create databases operating in Windows.

Agnieszka SzczepanekAuthor of the article.

\$PI\$ TREŚĆI

1	First	Step	3
		Download and Open	
		ond Step	
	2.1	Create Tables	4
3	Thir	d Step	7
	3.1	Relationships between tables	7

	4.1	Time for inserts:	. 10
5	Nex	t Steps	. 11
	5.1	MS Access Options	. 11
6	*Int	egration with MS SQQL	. 13
	6.1	Import data from MS SOI Server into MS Access	13

1 First Step

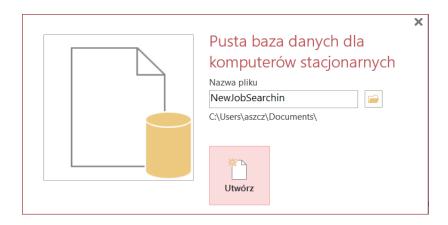

1.1 Download and Open

To download MS OFFICE with all components, also MS ACCES go to official website : https://products.office.com

If you already have MS OFFICE on your computer, try to find MS ACCESS in your package.

Click twice to open. First thing program will be asking for is to name database.

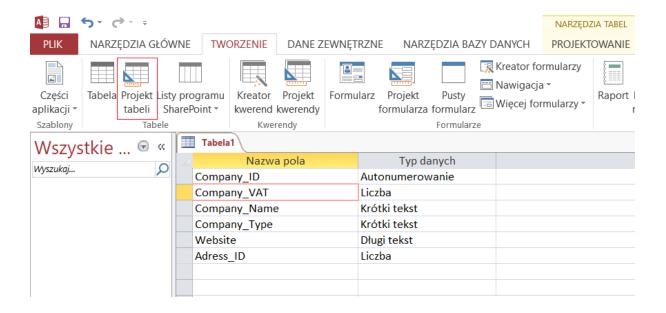

Put name of your database, my will be as above.

2 Second Step

2.1 Create Tables

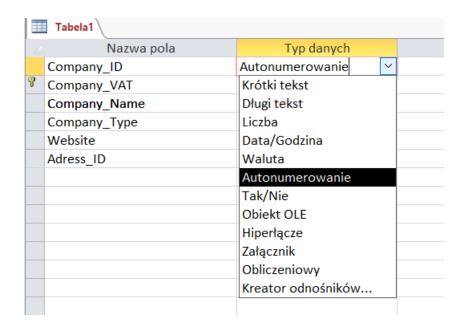

After named our database go to section *Create* and choose: *Table Project*. In contrast to MS SQL first thing we will do are columns: names and data types. My Project in Access will be the same as NewJob in SQL (https://sunsetgirlsql.wordpress.com/creating-databases-and-tables/).

As you can see above, data types are quite different, but we can choose from the drop down list:

- ✓ Long text,
- ✓ short text,
- ✓ number,
- √ date/hour,
- √ identity,

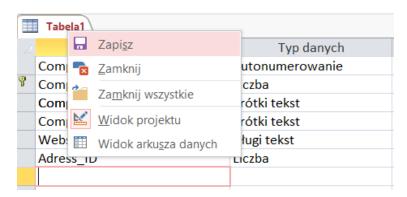

and some more. All of them you can find below:

If only you will finish creating columns, click twice on selected (usually first one) column in order to add a Primary Key as follow.

Now Table is ready to save, name of the table: Companies.

Do the same with **Addresses** and **applying**. As you can see, there's no order for creating tables, unlike MS SQL method.

For applying we have column called **Link**, so we can choose special data type for this one: hyperlink.

	Nazwa pola	Typ danych
P	Ref_No	Liczba
	Position	Krótki tekst
	Link	Krótki tekst
	Addresses_ID	Krótki tekst
	Company_VAT	Długi tekst
		Liczba
		Data/Godzina
		Waluta
		Autonumerowanie
		Tak/Nie
		Obiekt OLE
		Hiperłącze
		Załącznik
		Obliczeniowy
		Kreator odnośników

3 Third Step

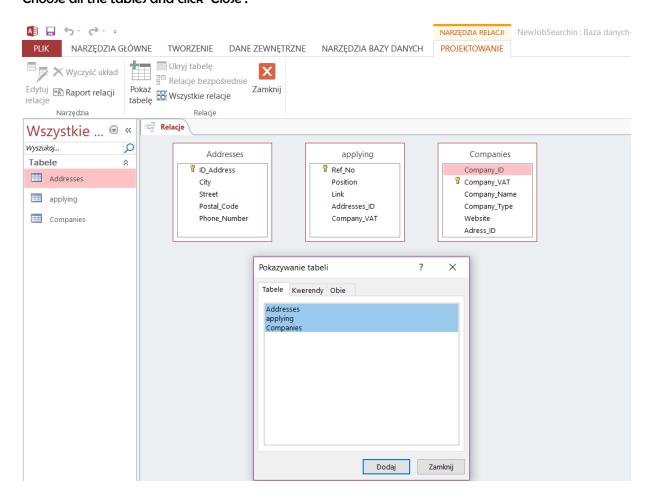

3.1 Relationships between tables

Now we should create relationships between this three tables.

Go to last section: Database Tools and click Relationships.

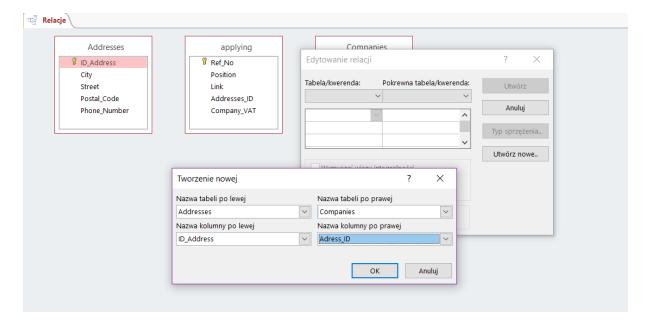

Choose all the tables and click 'Close'.

Hope, you still remember the relationships between the tables, if not take a look at the diagram (Page Creating and Modify on my website).

Now click on first table twice and we will have following dialog box:

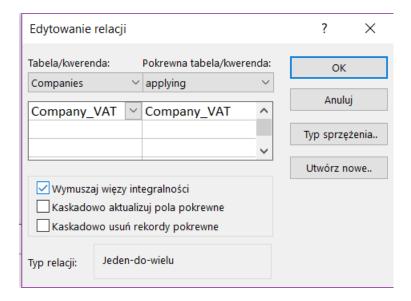

One to one relationship: Addresses - Companies.

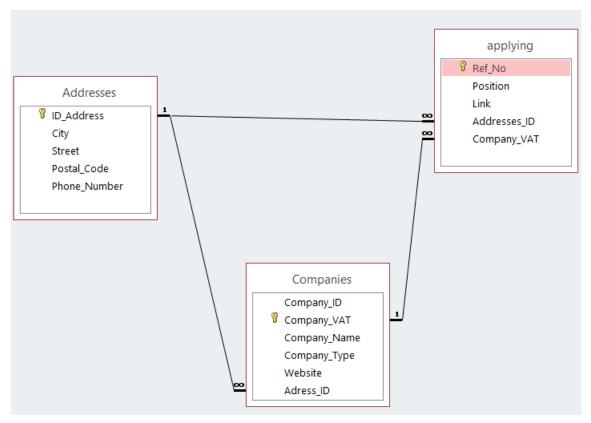

We need to choose left table, which is our major Adresses (with primary key) and column with PK: ID_Address. Then we need to choose related table: Companies and column: Addres_ID with FK.

One to many relationship: applying - Addresses, applying - Companies same way.

Now, we can edit created relationships and choose first option : enforce integrity bonds.

Ok, let's check what we have:

Click save.

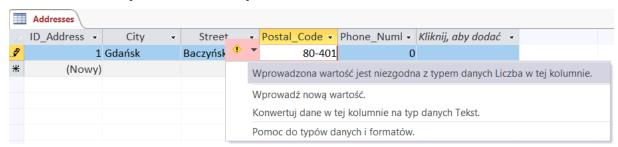

4 Fourth Step

4.1 Time for inserts:

Click twice on table Addresses.

Remember our fits column has identity data type, so there's no need to insert any nubers here.

We can start already with next one: City.

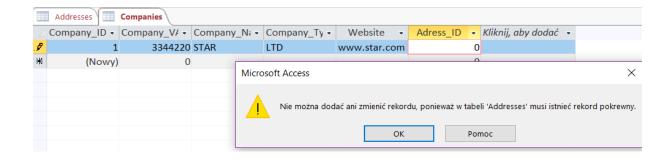

Postal Code is a number so don't insert any other symbols lie: -, /, ;, :, etc.

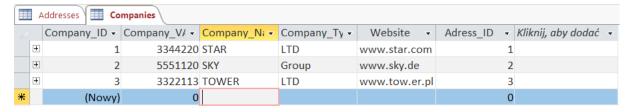

Click save, when you finish your inserts.

Second table is Companies with one FK.

Remember to choose correct ID for last column.

And save.

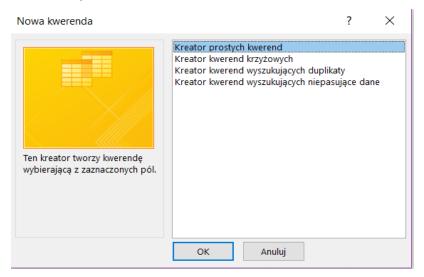

Last one: applying. Do it same way.

5 Next Steps

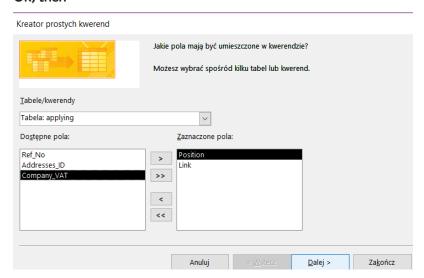

5.1 M\$ Access Options

After we finish all inserts we want to have in our database we can take a look for other tools MS ACCESS has for us: QUERIES and FORMS.

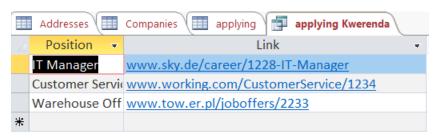

I have one query in my database, and it contains only two columns from table applying. Go to Query Creator and choose as follow:

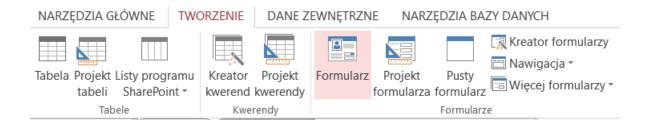

Ok, then

Result

Now go to section Creating and choose first option for application form:

MS ACCES gives us an opportunity to modify our forms as much as we want to by adding:

- Text box
- Button
- Website
- Picture
- Attachment and many more

Formantv

I put only picture to my form and made some modifications for the way it looks. Go ahead and try to create various types of forms

6 *Integration with M\$ \$QQL

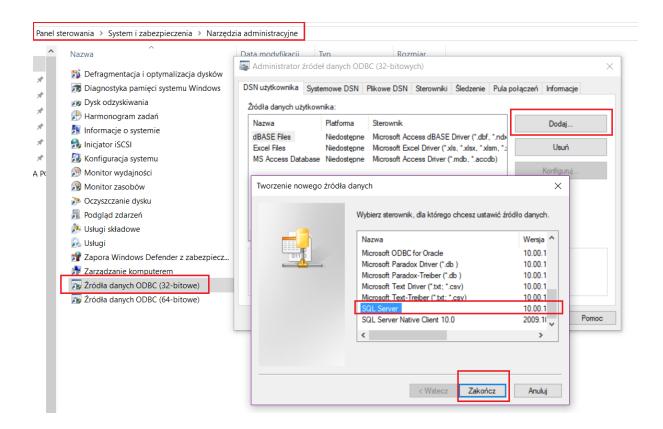

6.1 Import data from M\$ \$QI Server into M\$ Access

I showed you same basic options for our already existing in MS SQL database NewJob. In fact there's no need to create everything from the beginning if we already have solid base, saved as file with extension like:

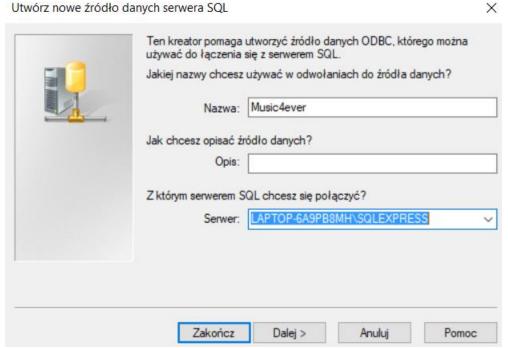

What to do if we want to export database from SQL to MS ACCES?

In our control panel we have administrative tools where we can find data sources. Click on them. In User DSN click add and then choose SQL Server from the list.

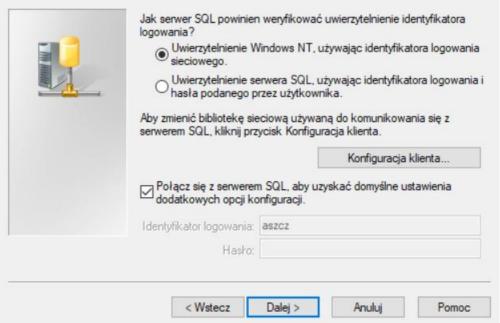

Name our database for MS ACCESS (or other future program) and choose server correctly.

Utwórz nowe źródło danych serwera SQL

Next

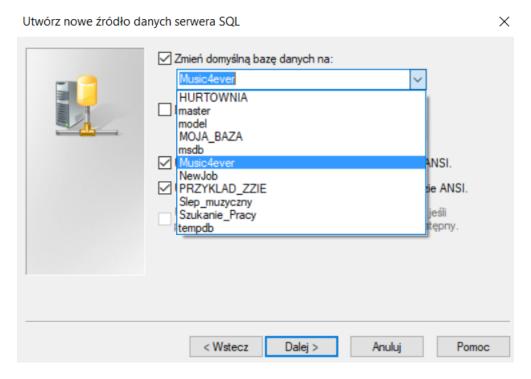

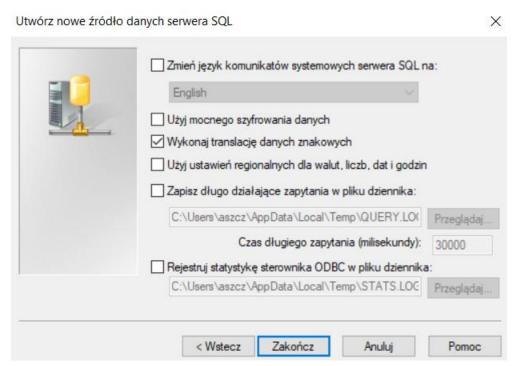

X

Next

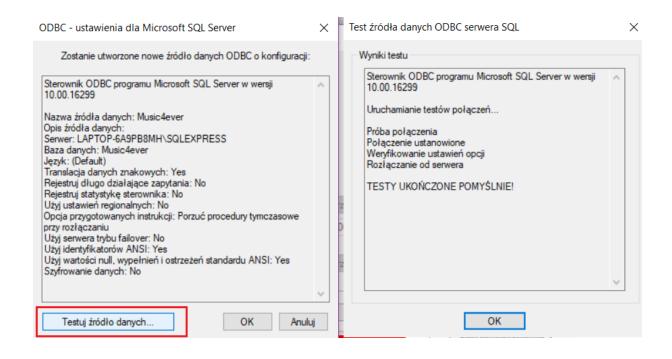

Change default database, as you can see list contains all existing databases that we have in MS SQL Server

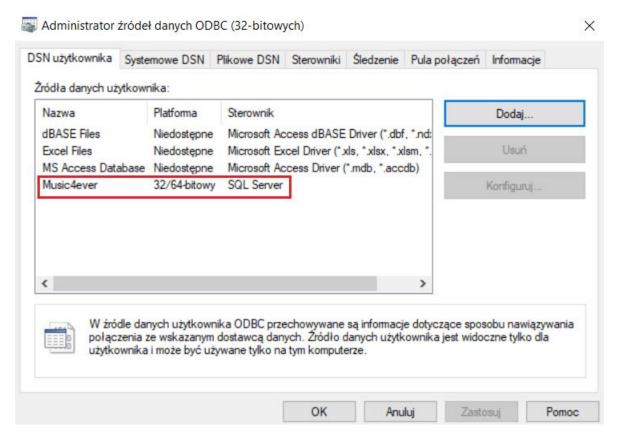

Next

Next

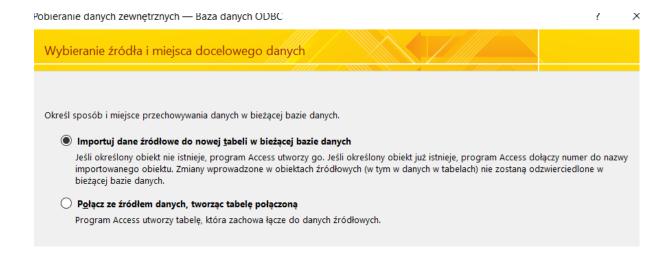

That's it

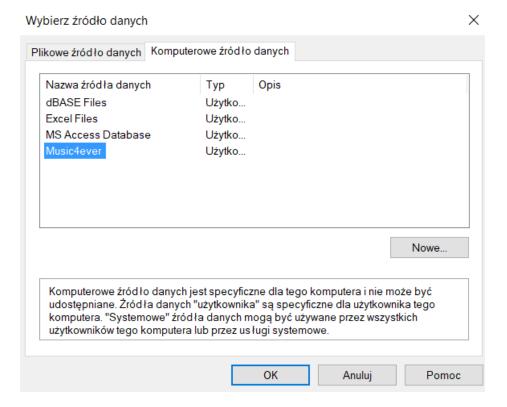

Now, go to MS ACCES, click on section: External data and choose ODBC Database

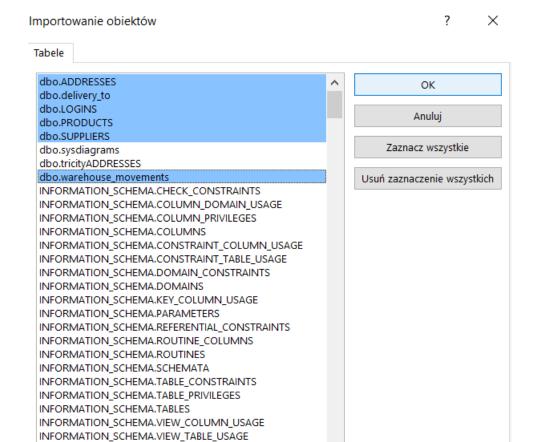

Choose first option: import source data into new table in the current database

Select second section and choose our prepared earlier database as source data

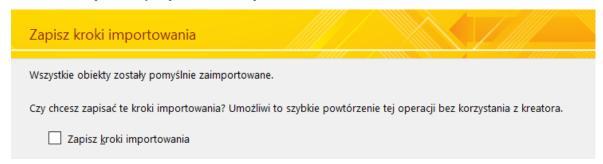

Choose all the tables you need

Last thing is to clik or nah "Save import steps" (will be easier to create it again).

Pobieranie danych zewnętrznych — Baza danych ODBC

INFORMATION_SCHEMA.VIEWS

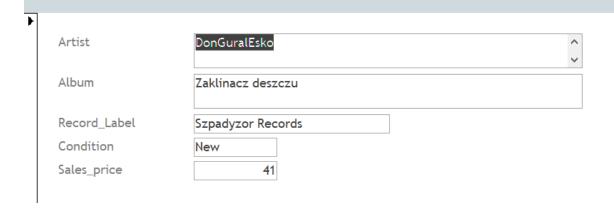

That's it [©]

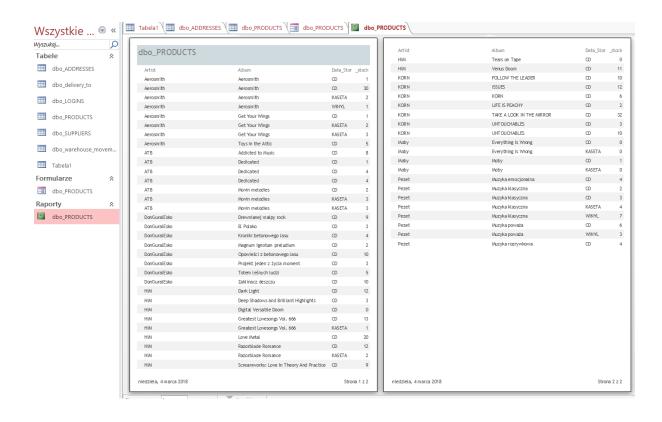

Below some screenshots from my imported database. Enjoy!
